Meta-analysis of the Effects of Intergroup Contact in Disadvantaged Groups

Dear colleagues,

We are conducting a meta-analysis of the effects of intergroup contact in disadvantaged groups. We are interested in the effects that have been referred to as the “ironic”, “sedative” or “demobilizing” effects of intergroup contact. We are currently gathering unpublished studies that meet the following criteria:

1. The study includes participants from a group that can be described as disadvantaged, in terms of status or resources, relative to another group within the same social context (this includes real and minimal groups).

2. The study measures or manipulates intergroup contact, or the opportunity for contact, with members of a relatively advantaged group.

3. The study measures at least one of the following:
   i. Perceptions of injustice (e.g., perceived discrimination, perceived deprivation)
   ii. Support for policies designed to benefit the disadvantage group (e.g., affirmative action)
   iii. Support for collective action favouring the disadvantaged groups (e.g., protest intentions)

If you have unpublished data that might meet these criteria, please complete the following survey: https://oxfordxpsy.az1.qualtrics.com/jfe/form/SV_37BkgTAbsliFG5. This will take about 5 to 15 minutes.

Your help is essential for gaining an accurate picture of the relevant relationships. Thank you in advance.
